No results of practical importance seem to flow from this assumption (pp. 145-6). 1603. () Case of dadr 0 in equations (lxv), or the least principal traction making the same angle with a radius-vector at every point of its length (pp. 145-56). Rp being a constant, we have in this case: a j C (da, J c--cos 2a where C, C, and c are arbitrary constants. Boussinesq applies results (lxx) to the consideration of the special case, where a cylindrical sector of material is placed between two intersecting rigid planes, sufficiently rough to stop all sliding of the particles of the material touching them. The application to the case where the rigid planes are hinged to a common axis and squeeze a wedge of plastic material placed between them might possibly have some practical interest. 1604. To the memoir is appended a Note Complementaire: Sur la methode de M. Macquorn-Rankine, pour le calcul des pressions exercees aux divers points dun massif pesant (pp. 157-173). The method dealt with by Boussinesq is that discussed in B and nkines memoir On the Stability of Loose Earth (see our Art. 453), but as it does not start from an elastic hypothesis, we have not considered it in our volume. Boussinesq explains and supplements Rankines investigations, but remarks of the hypothesis by which Rankine solves his fundamental equation: Peut-etre trouvera-t-on un jour quelque ordre de phenomenes auquel lhypothese considered sera plus applicable, et qui realisera ainsi cette curieuse...
