It may be thus detected in most minerals of which it is a large ingredient, provided they are infusible and do not contain too large a quantity of colored metallic oxides, or of magnesia. Very hard minerals, like corundum, must be finely pulverized (79). From acid solutions, when neutralized with ammonia, alumina is thrown down as a floeculent white precipitate. 97. Ammonia. The slight green tinge that salts of ammonia impart to the blowpipe flame (76) is too faint and uncharacteristic to serve for their detection. Ammonia is recognized by its well-known odor. The body to be tested is mixed with dry soda, the mixture placed in a closed glass tube, and gently heated, when the ammonia is evolved in the gaseous state, and may easily be recognized by its characteristic odor, as well...
